Notes:

1. TX Fault is an open collector output, which should be pulled up with a $4.7 \mathrm{k} \sim 10 \mathrm{k} \Omega$ resistor on the host board to a voltage between 2.0 V and $\mathrm{Vcc}+0.3 \mathrm{~V}$. Logic 0 indicates normal operation; logic 1 indicates a laser fault of some kind. In the low state, the output will be pulled to less than 0.8 V .
2. TX Disable is an input that is used to shut down the transmitter optical output. It is pulled up within the module with a $4.7 \mathrm{k} \sim 10 \mathrm{k} \Omega$ resistor. Its states are:

Low ( $0 \sim 0.8 \mathrm{~V}$ ): Transmitter on
( $>0.8 \mathrm{~V},<2.0 \mathrm{~V}$ ): Undefined
High (2.0~3.465V): Transmitter Disabled
Open: Transmitter Disabled

## SHENZHEN LIGHTWIT PHOTONICS CO., LTD.

3. MOD-DEF $0,1,2$ are the module definition pins. They should be pulled up with a $4.7 \mathrm{k} \sim 10 \mathrm{k} \Omega$ resistor on the host board. The pull-up voltage shall be VccT or VccR.

MOD-DEF 0 is grounded by the module to indicate that the module is present
MOD-DEF 1 is the clock line of two wire serial interface for serial ID
MOD-DEF 2 is the data line of two wire serial interface for serial ID
4. LOS is an open collector output, which should be pulled up with a $4.7 \mathrm{k} \sim 10 \mathrm{k} \Omega$ resistor on the host board to a voltage between 2.0 V and $\mathrm{Vcc}+0.3 \mathrm{~V}$. Logic 0 indicates normal operation; logic 1 indicates loss of signal. In the low state, the output will be pulled to less than 0.8 V .
5. These are the differential receiver output. They are internally AC-coupled $100 \Omega$ differential lines which should be terminated with $100 \Omega$ (differential) at the user SERDES.
6. These are the differential transmitter inputs. They are AC-coupled, differential lines with $100 \Omega$ differentia
